

GROUP 5

DBMS For Art Gallery Management

ABSTRACT

The Art Gallery Management System aims to efficiently manage and organize the database of an art gallery, providing accurate tracking and storage of art and paintings details. The system enhances safety and efficiency in managing exhibitions, gallery operations, and art stocks. Here's an abstract:

This project focuses on the design and implementation of an Art Gallery Management System, utilizing a MYSQL database platform with PHP and WAMP Server support. The system is developed to ensure effective management of art-related activities within the gallery. The primary functionalities include:

1. **Exhibition Management:** Tracks details of ongoing and upcoming exhibitions, including exhibit themes, dates, and participating artists.
2. **Gallery Management:** Manages gallery operations such as inventory management, artwork categorization, and gallery space utilization.
3. **Art Stocks:** Maintains a comprehensive database of art pieces and paintings, including details such as artist information, artwork descriptions, and pricing.

The application interface is developed using HTML5 and CSS3, with PHP facilitating dynamic content generation and interaction with the MYSQL database. Through this Art Gallery Management System, gallery administrators can streamline administrative tasks, enhance visitor experience, and effectively showcase the gallery's collection to art enthusiasts and patrons.

UNIVERSAL TABLE

Attribute Name	Data Type	Description
GID	INT	Gallery ID (Primary Key)
GNAME	VARCHAR(100)	Gallery Name
LOCATION	VARCHAR(200)	Gallery Location
EID	INT	Exhibition ID (Primary Key)
STARTDATE	DATE	Exhibition Start Date
ENDDATE	DATE	Exhibition End Date
	ARTISTID	INT
Artist ID (Primary Key)		
FNAME	VARCHAR(50)	Artist First Name
LNAME	VARCHAR(50)	Artist Last Name
BIRTHPLACE	VARCHAR(100)	Artist Birthplace
STYLE	VARCHAR(100)	Artist Style
ARTID	INT	Artwork ID (Primary Key)
TITLE	VARCHAR(200)	Artwork Title
TYPE_OF_ART	VARCHAR(100)	Type of Art
YEAR	INT	Year of Creation
PRICE	DECIMAL(10, 2)	Artwork Price
CUSTID	INT	Customer ID (Primary Key)
STREET	VARCHAR(200)	Customer Street Address
CITY_ID	INT	City ID (Foreign Key)
DOB	DATE	Customer Date of Birth
PHONE	VARCHAR(15)	Customer Phone Number
CITY	VARCHAR(100)	City Name

STATE	VARCHAR(100)	State Name
ZIPCODE	VARCHAR(20)	Zip Code

ER-DIAGRAM

MAPPING OF ER DIAGRAM TO RELATIONS

STEP 1: Mapping of Regular Entities

For each regular entity type E in the ER schema, create relation R that includes all simple attributes of E.

GALLERY

<u>GID</u>	GNAME	LOCATION
------------	-------	----------

EXHIBITION

<u>EID</u>	STARTDATE	ENDDATE
------------	-----------	---------

ARTIST

<u>ARTISTID</u>	FNAME	LNAME	BIRTHPLACE	STYLE
-----------------	-------	-------	------------	-------

CUSTOMER

<u>CUSTID</u>	ARTID	FNAME1	LNAME1	ADDRESS	PHONE	DOB
---------------	-------	--------	--------	---------	-------	-----

STEP 2 : Mapping of Weak Entity Types

ARTWORK

<u>ARTID</u>	ARTISTID	TITLE	TYPE_OF_ART	YEAR	PRICE
--------------	----------	-------	-------------	------	-------

FK

STEP 3: Mapping of 1:1 Relationship

Identify the relation S that represents the participating entity type at the 1-side of the relationship type.

Include as foreign key in S the primary key of the relations T that represents the other entity type participating in R.

For each binary 1:1 relationship type R in ER schema, identify the relations S and T that correspond to the entity types participating in R if any.

There are **no** 1:1 relationship.

STEP 4 : Mapping of 1:N Relationship

EXHIBITION

<u>EID</u>	STARTDATE	ENDDATE	GID
------------	-----------	---------	-----

FK

ARTIST

<u>ARTISTID</u>	FNAME	LNAME	BIRTHPLACE	STYLE	EID	GID	CUSTID
					FK	FK	FK

CUSTOMER

<u>CUSTID</u>	ARTID	FNAME1	LNAME1	STREET	CITY_ID	DOB	GID
	FK				FK	FK	

ARTWORK

<u>ARTID</u>	ARTISTID	TITLE	TYPE_OF_ART	YEAR	PRICE	EID	GID
	FK					FK	FK

CITY_ID

<u>CITY_ID</u>	CITY	STATE	ZIPCODE
----------------	------	-------	---------

STEP 5 : Mapping of M:N Relationship

Create a new relation S to represent R.

Include as foreign key attributes in S the primary key of the relations that represents the participating entity types their combination will form the primary key of S.

Also, include any simple attributes of the M:N relationship type as attributes of S.

STEP 6: Mapping of Multi-Valued Attributes

For each multivalued attributes A, create a new relation R. This relation R will include an attribute corresponding to A, plus the primary key attribute K-as a foreign key in R-

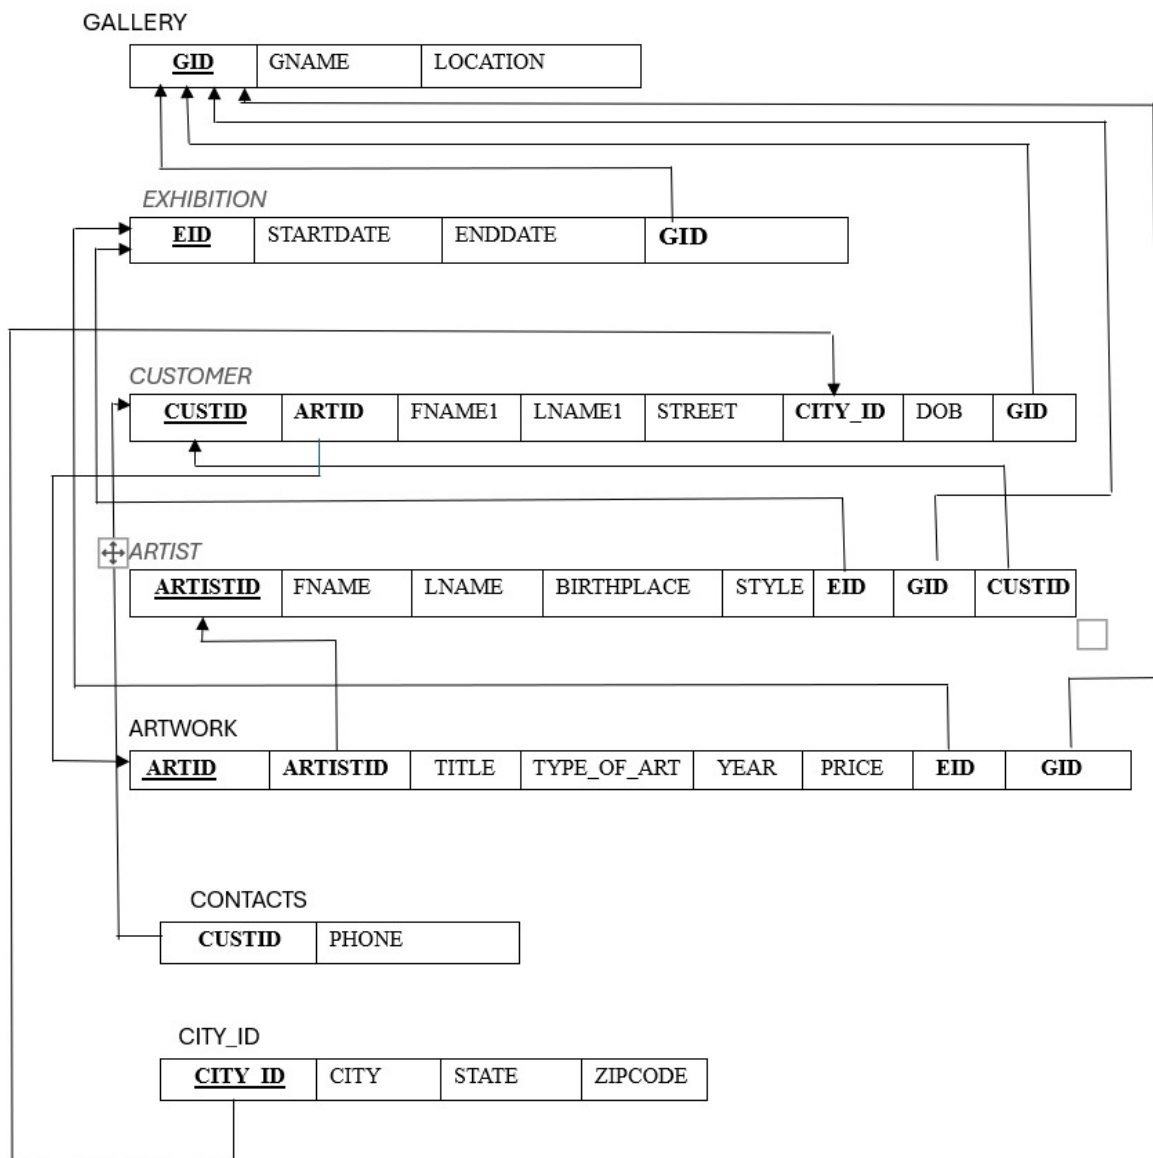

of the relation that represents the entity type of relationship type that has A as an attribute.

The Primary Key of R is the combination of A and K. If the multivalued attribute is composite, we include its simple components.

CONTACTS

<u>CUSTID</u>	PHONE
---------------	-------

SCHEMA DIAGRAM

NORMALIZE THE RELATIONS

Database normalization, or simply normalization, is the process of organizing the columns(attributes) and tables(relations) of a relational database to reduce data redundancy and improve data integrity. Normalization involves arranging attributes in relations based on dependencies between attributes.

1. First Normal Form

As per First normal form, no two rows of data must contain repeating group of information. Each set of columns must have a unique value, such that multiple columns cannot be used to fetch the same row. Each table should be organized into rows, and each row should have a primary key that will distinguishes it as unique.

Example:

GALLERY

<u>GID</u>	GNAME	LOCATION
------------	-------	----------

All the tables in the database are normalized to 1NF as all the attributes are atomic.

2. Second Normal Form (2NF)

A table is in 2NF if it is in 1NF and if all non-key attributes are fully functionally dependent on all of the key.

Example:

CUSTOMER

<u>CUSTID</u>	ARTID	FNAME1	LNAME1	STREET	CITY_ID	DOB	GID
FD1↑							

FD1

<u>CUSTID</u>	FNAME1	LNAME1	DOB
---------------	--------	--------	-----

3. Third Normal Form(3NF):

A table is in 3NF if it is in 2NF and if it has no transitive dependency. $X \rightarrow Y, Y \rightarrow Z, X \rightarrow Z$

According to CODD's definition a relation schema R is in 3NF. It satisfies 2NF and no non-prime attribute of R is transitively dependent on the primary key. All tables of database satisfies upto 3NF.

CREATION OF TABLES

Table 1: GALLERY

```
CREATE TABLE GALLERY (  
    GID INT PRIMARY KEY,  
    GNAME VARCHAR(100) NOT NULL,  
    LOCATION VARCHAR(200) NOT NULL  
);
```

Table 2: EXHIBITION

```
CREATE TABLE EXHIBITION (  
    EID INT PRIMARY KEY,  
    STARTDATE DATE NOT NULL,  
    ENDDATE DATE NOT NULL,  
    GID INT,  
    FOREIGN KEY (GID) REFERENCES GALLERY(GID)  
);
```

Table 3: ARTIST

```
CREATE TABLE ARTIST (  
    ARTISTID INT PRIMARY KEY,  
    FNAME VARCHAR(50) NOT NULL,  
    LNAME VARCHAR(50) NOT NULL,  
    BIRTHPLACE VARCHAR(100),  
    STYLE VARCHAR(100)  
);
```

Table 4: ARTWORK

```
CREATE TABLE ARTWORK (  
    ARTID INT PRIMARY KEY,  
    ARTISTID INT,  
    TITLE VARCHAR(200) NOT NULL,  
    TYPE_OF_ART VARCHAR(100),  
    YEAR INT,  
    PRICE DECIMAL(10, 2),  
    EID INT,  
    GID INT,  
    FOREIGN KEY (ARTISTID) REFERENCES ARTIST(ARTISTID),  
    FOREIGN KEY (EID) REFERENCES EXHIBITION(EID),  
    FOREIGN KEY (GID) REFERENCES GALLERY(GID)  
);
```

Table 5: CUSTOMER

```
CREATE TABLE CUSTOMER (  
    CUSTID INT PRIMARY KEY,  
    FNAME VARCHAR(50) NOT NULL,  
    LNAME VARCHAR(50) NOT NULL,  
    STREET VARCHAR(200),  
    CITY_ID INT,  
    DOB DATE,  
    GID INT,  
    FOREIGN KEY (GID) REFERENCES GALLERY(GID)  
);
```

Table 6: CITY

```
CREATE TABLE CITY (  
    CITY_ID INT PRIMARY KEY,  
    CITY VARCHAR(100) NOT NULL,  
    STATE VARCHAR(100) NOT NULL,  
    ZIPCODE VARCHAR(20) NOT NULL  
);
```

Table 7: CONTACTS

```
CREATE TABLE CONTACTS (  
    CUSTID INT,  
    PHONE VARCHAR(15),  
    PRIMARY KEY (CUSTID, PHONE),  
    FOREIGN KEY (CUSTID) REFERENCES CUSTOMER(CUSTID)  
);
```

Additional Considerations

- All primary key constraints ensure that each record is uniquely identifiable.
- Foreign key constraints establish the relationships between tables, ensuring referential integrity.

Execution of Queries

1) Aggregate functions, Group by...having

The screenshot shows a web-based SQL interface. At the top, a green banner states "Your SQL query has been executed successfully." Below this, the executed query is displayed: `SELECT type_of_art, COUNT(*) AS total_artworks FROM artwork GROUP BY type_of_art HAVING COUNT(*) > 1;`. Under the query, there are links for "Profiling", "Edit inline", "Edit", "Explain SQL", "Create PHP code", and "Refresh". A button labeled "Extra options" is also present. The query results are shown in a table with two columns: "type_of_art" and "total_artworks". The first row shows "Painting" with a count of 4.

type_of_art	total_artworks
Painting	4

2) Order by

✓ Showing rows 0 - 6 (7 total, Query took 0.0002 seconds.) [fname: AASHU... - PRASHANT...]

```
SELECT custid, fname, lname, dob, address FROM customer ORDER BY fname ASC;
```

❑ Profiling [Edit inline] [Edit] [Explain SQL] [Create PHP code] [Refresh]

❑ Show all | Number of rows: 25 | Filter rows: Search this table | Sort by key: None

Extra options

				custid	fname	lname	dob	address
❑	Edit	Copy	Delete	AR2022	Aashu	Demo	2022-05-10	Delhi
❑	Edit	Copy	Delete	AR2025	Aashut	Demo0	2022-05-10	Delhi
❑	Edit	Copy	Delete	AT2000	Akshay	Thakur	2000-04-16	New York
❑	Edit	Copy	Delete	AR1998	Ashutosh	Ranjan	1998-02-04	Paris
❑	Edit	Copy	Delete	AM1994	Avanish	Mehta	1994-10-05	Mumbai
❑	Edit	Copy	Delete	AD1998	Ayush	Dhar	1998-09-28	London
❑	Edit	Copy	Delete	PM1996	Prashant	Mehta	1996-06-18	Washington

3) Join, Outer Join

✓ Showing rows 0 - 5 (6 total, Query took 0.0002 seconds.)

```
SELECT a.artistid, a.fname1, a.lname1, g.gname, g.location FROM artist a LEFT JOIN gallery g ON a.gid = g.gid;
```

❑ Profiling [Edit inline] [Edit] [Explain SQL] [Create PHP code] [Refresh]

❑ Show all | Number of rows: 25 | Filter rows: Search this table

Extra options

artistid	fname1	lname1	gname	location
ART1	Georgia	O Keeffe	METROPOLITAN MUSEUM	New York
ART2	Pablo	Picasso	THE LOUVRE MUSEUM	Paris
ART3	Rembrandt	van Rijn	BRITISH MUSEUM	London
ART4	Theodore	Chasseriau	JAHANGIR GALLERY	Mumbai
ART5	Leonardo	da Vinci	NATIONAL GALLERY	Washington
ART7	Mind	Hunter	MY GALLERY	Patna

4) Query having Boolean operators

✓ Showing rows 0 - 1 (2 total, Query took 0.0002 seconds.)

```
SELECT custid, fname, lname, address FROM customer WHERE address = 'New York' OR address = 'Paris';
```

❑ Profiling [Edit inline] [Edit] [Explain SQL] [Create PHP code] [Refresh]

❑ Show all | Number of rows: 25 | Filter rows: Search this table | Sort by key: None

Extra options

				custid	fname	lname	address
❑	Edit	Copy	Delete	AR1998	Ashutosh	Ranjan	Paris
❑	Edit	Copy	Delete	AT2000	Akshay	Thakur	New York

5) Query having arithmetic operators

✓ Showing rows 0 - 0 (1 total, Query took 0.0004 seconds.)

```
SELECT artid, title, price FROM artwork WHERE price > (SELECT AVG(price) FROM artwork);
```

☐ Profiling [[Edit inline](#)] [[Edit](#)] [[Explain SQL](#)] [[Create PHP code](#)] [[Refresh](#)]

☐ Show all | Number of rows: 25 | Filter rows:

Extra options

← T →

	artid	title	price
<input type="checkbox"/> Edit Copy Delete	AW12	Mona Lisa	1000000000.00

6) A search query using string operators

✓ Showing rows 0 - 0 (1 total, Query took 0.0001 seconds.)

```
SELECT artistid, fname1, lname1 FROM artist WHERE fname1 LIKE 'P%';
```

☐ Profiling [[Edit inline](#)] [[Edit](#)] [[Explain SQL](#)] [[Create PHP code](#)] [[Refresh](#)]

☐ Show all | Number of rows: 25 | Filter rows:

Extra options

← T →
